Top Skills

Full-Stack Development
Software Architecture
Agentic AI Development

Emmett Sewell

Systems Engineering Student @ Simon Fraser University and Full Stack Developer and Technical Resource @ MAKE Projects LTD.
Vancouver, British Columbia, Canada

Summary

Systems Engineering student at SFU and sole developer of an internal project management platform built for and deployed inside MAKE projects. Previous experiences include being an IT technician at Broadway Moving and Storage, where the focus was self-hosted infrastructure and internal systems. The internal platform for MAKE began as a no-code prototype. I migrated it onto React/Vite with a Supabase/Postgres backend on Vercel, designed the data model and the role-based permission architecture underneath it, and hold architecture, security, deployment, QA, and documentation as the only technical person on the product. Requirements arrive from project managers, not software engineers, translating operational workflow into systems design is most of the job. What makes solo ownership at that scope viable is agentic AI used as build infrastructure rather than autocomplete. Implementation runs through CLI coding agents working against repo-level sepcs; architecture, debugging, and research happen in a separate reasoning context; a persistent memory layer carries decision logs across sessions. The leverage is real, but it only holds because of the constraints around it. Nothing ships until it clears a fixed validation pass, this being an intent check against the original requirements, minimum five-case edge audit, integration verification, UX stress test, and documentation sync. Database permissions are audited independently through a read-only connection rather than trusting the application layer to enforce what I assume it enforces. Generated code is never treated as a result and solution, but rather a proposal that needs refinement and review. Before this software experience, I began with infrastructure. I've been the IT technician for Broadway Moving and Storage since 2023 and still hold the role. I spec'd and produced the self-hosted infrastructure, deployed the internal systems the business runs on, integrated the NVR and physical security stack into it, and built GPS driven automated fleet management across the truck fleet. Built solo, maintained solo, three years running, with a working business

depending on it daily. The through line is owning the whole stack and staying responsible for it in production. Currently finishing my degree while continuing on the platform. Interested in AI systems, developer tooling, and infrastructure.

Experience

MAKE PROJECTS LTD

Project Coordinator / Software Developer (Intern)

May 2026 - Present (4 months)

Vancouver, BC

Hired as a project coordinator intern; scope shifted to software development within the first month and became full-time engineering work on an internal software platform for MAKE. Sole developer on the project.

- Migrated off pre-existing Base44 prototype onto a purpose built stack. React/Vite frontend, Supabase/Postgres backend, deployed on Vercel
- Designed the relational data model and permission architecture: role-based access control across owner, contractor, and consultant roles, enforced with Postgres row-level security.
- Owned deployment and release process end to end, including a dev branch migration workflow with controlled promotion to production.
- Translated requirements from project management staff, none of them software engineers, into product architecture and shipped features, working directly with the platform's manager on functionality decisions while holding technical decision making autonomy.
- Ran security hardening across authentication, authorization, and RLS policy coverage, auditing the database directly rather than relying on application layer checks.
- Led internal testing workshops with the broader project team and folded feedback into the roadmap ahead of company wide rollout.
- Built and maintained the platform solo using agentic development workflows, spec-driven CLI coding agents, separate architecture/debugging context, and persistent decision logging, gated by a fixed five stage protocol and independent read-only auditing of the database permissions policies.

Received a promotion in August 2026 and continued working on the platform as a Full Stack Developer and Technical Resource.

Broadway Moving and Storage

6 years 3 months

IT Technician

May 2023 - Present (3 years 4 months)

Vancouver, BC

Sole technical resource for a moving and storage operation running on infrastructure I specced, built, and maintained.

- Procured and deployed self-hosted server infrastructure, moving the business onto systems and administered in house.
 - Built and deployed the internal custom systems the company runs on day to day.
 - Integrated NVR and physical security stack directly into that infrastructure rather than running it as an isolated vendor appliance.
 - Implemented custom GPS driven automated fleet management across the truck fleet.
 - Own operations end to end; server uptime and maintenance, upgrades and hardware repair, security system upkeep, and frontline support for all staff.
- Built solo, maintained solo, with a live operating business depending on it daily.

Driver

June 2020 - Present (6 years 3 months)

Vancouver, BC

Operate 3 and 5 ton diesel trucks on residential and commercial moves, working directly with customers across a wide range of job sites. The operational exposure from this role is what later informed the internal systems I built for the business.

Point Grey Projects

Apprentice Carpenter

January 2021 - August 2021 (8 months)

Vancouver, British Columbia, Canada

Working for Point Grey Projects allowed me to see through the complete construction of a modern home. I was heavily involved in every step of the project, since my schooling was part-time due to COVID. I learned invaluable skills in a true worksite environment, being surrounded by many different tradesmen and learning from each of them.

Education

Simon Fraser University

Bachelor of Applied Science - BASc, Systems Engineering · (September 2022 - June 2027)

Prince of Wales Mini School

High School Diploma · (September 2017 - June 2022)
